Single Page Applications

Mendel Rosenblum

Web Apps and Browsers

- Web apps run in browsers (by definition)
- Users are use to browsing in browsers
  - Browser maintains a history of URLs visited
    - Back button - Go back in history to previous URL
    - Forward button - Go forward in history to next URL

  - Can move to a different page
    - Typing into location bar or forward/back buttons
    - Selecting a bookmarked URL
    - Page refresh operation

- Browser tosses the current JavaScript environment when navigating to a different page
 - Problematic for JavaScript frameworks: URL (and cookies) are the only information preserved

Problem with some web apps

Confirm Reload
All will be lost!
Are you sure you want to reload this page?
☐ Prevent this page from creating additional dialogs.
Don't Reload   Reload this Page

- Initial: pages served from web server
  - Each page had a URL and app switched between pages served by web server

- Early JavaScript apps: Website a single page/URL with the JavaScript

  Problem: Restart web app on navigation (Can lose a lot of work!)
  ```
  window.onbeforeunload = function(e) { return 'All will be lost!'; }
  ```

- Users expect app in browser to do the right thing:
  - Navigate with forward and back buttons, browser page history
  - Navigate away and come back to the app
  - Bookmark a place in the app
  - Copy the URL from the location bar and share it with someone
  - Push the page refresh button on the browser
Changing URL without page refresh

- Can change hash fragment and query parameters in URL without reload

  ```
  http://example.com
  http://example.com#fragment
  http://example.com?id=3535
  http://example.com?id=3535#fragment
  ```

- HTML5 give JavaScript control of page reload

Deep linking

- Concept: the URL should capture the web app's context so that directing the browser to the URL will result the app's execution to that context
  - Bookmarks
  - Sharing

- Context is defined by the user interface designer!

  Consider: Viewing information of entity and have an edit dialog open

  Should the link point to the entity view or to the entity & dialog?

  Does it matter if I'm bookmarking for self or sharing with others?

  How about navigating away and back or browser refresh?

Deep linking in Single Page Apps

Two approaches:

1. Maintain the app's context state in the URL
    + Works for browser navigation and refresh
    + User can copy URL from location bar

2. Provide a share button to generate deep linking URL
    + Allows user to explicitly fetch a URL based on need
    + Can keep URL in location bar pretty

Either way web app needs to be able to initialize self from deep linked URL

Ugly URLs

```
http://www.example.org/dirmod?sid=789AB8&type=gen&mod=Core+Pag
es&gid=A6CD4967199
```

versus

```
http://www.example.org/show/A6CD4967199
```

What is that ugly thing in the location bar above my beautiful web application?

```
https://www.flickr.com/photos/jarnasen/24593000826/in/explore-2016-01-26/
```

Angular Support for SPA

- Idea: Do client-side routing of URLs to view components
  - Several different Angular URL routing frameworks written, no clear winner at this point

- `ngRoute` - provides routing and deep linking
  - We'll use this one in class

- `ngRoute` is an Angular API that provides:
  - A directive (`ngView`) to indicate where view components should be inserted in template
  - A service (`$route`) that watches `window.location` for changes and updates the displayed view.
  - A configuration ($routeProvider) that allows the user to specify the mappings of URLs to view components.

Using ngRoute

- In a view template (frequently the "shell" of the web application)

  ```
  <div ng-view></div>
  ```

- In your Angular module add ngRoute as a dependency

  ```
  angular.module('cs142App', ['ngRoute'])
  ```

- Configure the routing table in a module config block

  ```
  cs142App.config(['$routeProvider', function($routeProvider) {
  ```

ngRoute - Specify URL ⇒ View mapping

```
cs142App.config(['$routeProvider', function($routeProvider) {
    $routeProvider
        .when('/Book/:bookId', {
         templateUrl: 'book.html',
         controller: 'BookController',
         })
      .when('/Book/:bookId/ch/:chapterId', {
       templateUrl: 'chapter.html',
       controller: 'ChapterController'
     });
    }]);
```

ngRoute - Passing parameters to controllers

```
<a href="#!/Book/Moby">...</a>
cs142App.controller('BookController', ['$routeParams',
    function($routeParams) {
        $routeParams.bookId  // Will be "Moby"
    }]);

<a href="#!/Book/Gatsby/ch/3">...</a>
cs142App.controller('ChapterController', ['$routeParams',
        function($routeParams) {
            $routeParams.bookId   // Will be "Gatsby"
            $routeParams.chapterId    // Will be "3"
    }]);
```

ngRoute handles query params as well

```
<a href="#!/Book/Moby?noShow=true&upsideDown=Yes">...</a>

cs142App.controller('BookController', ['$routeParams',
    function($routeParams) {
        $routeParams.bookId  // Will be "Moby"
        $routeParams.noShow  // Will be "true"
        $routeParams.upsideDown  // Will be "Yes"

    }]);
```

Example

What to keep in URL: table length, viewport in table, search box, sort column, etc.
Is it different for bookmark or share? Nav away and back?

Example: Not everything goes in URL
